SINGLE PILOT CHECK VALVES

Belonging to the same range as the in-line check valves, but different in that they allow the valve to open in the direction that is normally allowed. The high level of pilot ratio, realized in the design phase, enables rapid and complete opening for the whole duration of the desired cycle.

The construction material used for the seal pistons, the hardened treatment that these are subjected to, as well as the finish-grinding guarantee a perfect seal even in particularly adverse working conditions.

Uses

The above mentioned valves are generally used for blocking work circuits under pressure, such as guarding against falling loads in the event of pipe braking or against creeping movements for hydraulically blocks systems.
